TITLE: Second Meeting of the Commission on Agricultural Meteorology  
of the World Meteorological Organization (Vtoraya sessiya  
komissii po sel'skokhozyaystvennoy meteorologii Vsemirnoy  
meteorologicheskoy organizatsii)

PERIODICAL: Meteorologiya i hidrologiya, 1959, Nr 2, pp 67-69 (USSR)

ABSTRACT: The second meeting was held between September 29 and October  
17, 1958 in Warsaw. The USSR was represented by M. S. Kulik,  
V. P. Popov and A. M. Chikalov. Ye. S. Ulanova was elected  
representative of the USSR in the Study Group for the Compilation  
of Weather Forecasts for Agriculture. F. F. Davitaya was elected  
Soviet representative in the analogous Study Group on  
Climatological Informatics for Agriculture. I. A. Gol'tsberg  
was voted representative of the USSR in the Study Group for  
the Drawing-up of Recommendations in the Fight Against Damage  
Due to Morning Frost, and L. A. Razumova Soviet representative  
in the Study Group on the Efficacy of Forest Strips. S. Bac  
(Poland) developed a simple apparatus for the determination of  
the scope of movements of soil strata in connection with the  
freezing and melting of the soil. An apparatus of similar design is

Card 1/2

Meteorology of the World Meteorological Organization

SOV/50-59-2-22/25

being used by the Sabakino (Moscow oblast') Station of Agrometeorology. The Soviet delegates reported on the radioactive method of determining the moisture of the soil (developed by Danilin), on the inexpensive and convenient pluviometer designed by Davitaya, on the feeler thermometer developed by Shekhan, on the evaporator designed by Popov, on the electric thermometers for the determination of the temperature at the tiller (Bestockungsknoten) of winter seed. Mention is made of the reports delivered by the delegates from the USA and France. Soviet delegate V. P. Popov delivered a report on the principles of agroclimatic district classification. The other Soviet delegate, M. S. Kulik, spoke on agroclimatic indices for the drought. Soviet representative in the Study Group on Problems of Agroclimatic district classification is F. F. Davitaya. M. Austin Burke (Ireland) was elected by secret ballot President of the Commission, while M. S. Kulik (USSR) was elected Vice-President.

TITLE: Effectiveness of the use of fertilizer as a function of meteorological factors  
[This paper was presented at the Agricultural Weather Forecasting Conference held in Kechkemet from 15 to 19 September 1964.]

SOURCE: Idojaras, v. 69, no. 3, 1965, 148-153

TOPIC TAGS: soil property, fertilizer, atmospheric temperature, atmospheric moisture

ABSTRACT: It was shown that the effectiveness of fertilizer utilization decreases in the Soviet Union from the North-Western to the South-Eastern direction. This phenomenon was explained in terms of meteorological factors. A discussion of these factors led to the conclusion that the effectiveness of fertilizer utilization could be significantly increased by utilizing the meteorological phenomena such as atmospheric temperature, atmospheric and soil moisture content, etc. Of special significance is the period during which the average daily temperature is within 10° and 15°C. The onset of this period can be forecast by the method developed by Davitaya, F. F. Orig. art. has: 2 figures. [Based on author's Eng. abst.] [JPRS]

TITLE: Nonadditivity of properties of the constituents of a graft polymer

SOURCE: AN UkrSSR. Modifikatsiya svoystv polimerov i polimernykh materialov (Modi-  
fication of the properties of polymers and polymeric materials). Kiev, Naukova  
dumka, 1965, 5-8

TOPIC TAGS: synthetic fiber, graft copolymer, polyacrylonitrile, polyvinyl acetate

ABSTRACT: The effect of a grafted layer on the properties of modified caprone fiber  
was investigated. The properties of graft copolymers were studied by determining  
the dyeability and adhesiveness of the fibers. Experiments with an acid dye (acid  
blue) and a basic dye (fuchsin) showed that caprone fiber containing 6% of grafted  
polyacrylonitrile increases the sorption of acid blue by a factor of 1.5, and that

Card 1/2

L 16011-66

ACC NR: AT6006235

of fuchsin, by a factor of 4 as compared to the unmodified fiber. Similar results were obtained with fiber modified with polyvinyl acetate. Thus, the dyeability depends little on the nature of the grafted layer or on the type of dye, indicating that the properties of the modified polymer are not determined by the properties of the substrate and of the grafted layer. A similar picture was obtained in a study of the adhesion of caprone fibers to grafted polydivinyl, poly-2-methyl-5-vinylpyridine, and polyisoprene. In the case of SKB rubber<sup>b</sup>, the samples showed a higher adhesion after grafting, but in the case of NK-1 natural rubber<sup>c</sup>, the adhesion of caprone cord not only did not increase, but decreased, and the properties of the modified caprone fiber were practically independent of the chemical nature of the grafted layer. It is suggested that physical factors associated with a change in the structure of the "substrate" were strongly manifested in the case of natural rubber. Thus, the nonadditivity of the properties of the grafted layer and base polymer is displayed in the dyeability and adhesiveness to natural rubber. Orig. art. has: 1 figure, 3 tables.

TITLE: Method for experimental determination of the coefficient of thermal conductivity of a high temperature gas

SOURCE: Teplofizika vy\*skikh temperatur, v. 1, no. 3, 1963, 394-398

TOPIC TAGS: high temperature gas, high temperature gas flow, stream-line, blunt body, critical point, molecular heat conduction, laminar boundary layer, molecular thermal conductivity, thermal conductivity coefficient

ABSTRACT: An experimental method is presented which is based on the fact that regardless of the conditions in an incident flow around a blunt body, the stream in a small area around the critical point is always laminar. Since heat transport transverse to the

Card 1/8

ACCESSION NR: AP4017719

laminar boundary layer is due only to molecular heat conduction, measurement of the temperature profile in the boundary layer near the critical point and determination of the heat flux at this point yields the value of the coefficients of molecular thermal conductivity in a larger range of temperatures than possible heretofore. The experimental set-up has been described elsewhere (V. B. Tikhonov, Ye. A. Yakovlev, Sb. tr. MAI, A. V. Kvasnikov, ed, Oboron-giz 1960). The experimental results agreed within 9% at  $T = 12,000\text{K}$  and 5% at  $T = 14,000\text{K}$  with approximate theoretical values calculated by the method of W. Lochte-Holtgreven (Repts. Progr. Phys. v. 21, 312, 1958). It is pointed out that the method is most effective at high pressures. Orig. art. has: 7 figures and 3 formulas.

TITLE: Theoretical calculation of the viscosity, thermal conductivity, and Prandtl number of ionized argon

SOURCE: Teplofizika vy\*sokikh temperatur, v. 1, no. 1, 1963, 56-63

TOPIC TAGS: argon, ionization, viscosity, thermal conductivity, viscosity, aerodynamics, high temperature, gas dynamics, argon ionization, ionized argon

ABSTRACT: It is shown that the presence of electrically charged particles in the ionized gas gives rise to long-range Coulomb forces between the particles along with the short-range atomic forces, and this increases the effective cross sections for the elastic interactions. One of the consequences is a sharp decrease in the viscosity coefficient of the gas and its pressure dependence. It is also

Card 1/0

ACCESSION NR: AP4000401

pointed out that knowledge of the gas kinetic properties of gases at temperatures much higher than experimentally feasible is of great importance in specific problems of aerodynamics and gas dynamics. Information is culled from a large number of Soviet and western sources, and the final results are presented in graphic and tabular form. Thermodiffusion effects are neglected. Original article has 2 tables, 4 figures, and 15 formulas.

KULIK (S. A.). Образование видов у грибов *Fusarium* в искусственных условиях. [Formation of species in the fungus *Fusarium* under artificial conditions.]—Агробиология [Agrobiology], 1950, 6, pp. 28-36, 7 figs., 1950.

During the course of isolations from the underground parts of wheat plants over a period of two years at the Plant Protection Laboratory of the Siberian Scientific Research Institute for Cereal Farming, Omsk, 38 strains of *Fusarium* spp. were obtained. From all kinds of wheat seed *F. avenaceum* [R.A.M., 28, p. 184] was the only one isolated; it was never encountered in the roots or in the soil and only rarely on the collar.

Single-spore cultures of *F. avenaceum*, which showed constant growth characters on potato dextrose agar, were grown in soil. From 108 of these cultures four days later only *F. herbarum* [*F. avenaceum*: ibid., 16, p. 243] could be isolated. These latter isolates maintained their characters when grown on various agars and natural media, such as wheat and rice grains, and continued to do so through three generations of single-spore cultures. After alternate low and high temperature treatments it was found that the mycelium which developed from one end of a single spore had the characters of *F. herbarum*, and from the other end those of *F. avenaceum*. These two forms were quite distinct morphologically and culturally, and there was no intermediate form. When grown in dual culture toxins were produced which caused the two to be antagonistic to one another.

Field studies showed that some agricultural methods, such as cultivation and manuring, change the balance between the number of parasitic and saprophytic species in the soil, decreasing the former and increasing the latter. A study of the conditions under which parasitic species of fungi may become saprophytic may give an opportunity of working out efficient measures for control of the fusaria of wheat and other crops.

TITLE: Experience gained with the operation of two АРС-10 (DFS-10) instruments in the Dneprospetsstal' plant

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Seriya fizicheskaya, v. 26, no. 7, 1962, 907-913

TEXT: Two DFS-10 quantometers were put into operation in November 1960 for analyzing low- and medium-alloy steels. Rapidity and accuracy were satisfactory as also was the amplifying and recording unit. The following drawbacks were found: (1) As it is not always possible to create the necessary air-conditioning a cooling unit should be fitted. (2) Problems of steel analysis cannot always be solved by low-voltage sparks and arcs. A condensed spark generator should therefore be included. (3) Due to variations in battery voltage, the calibration of the instrument is gone in the course of one day. (4) The F3Y-1 (GEU-1) generator does not provide for continuous operation of the instrument, as repairs take half the time. On medium-alloy steels accuracy of

Experience gained with the operation ... B104/B138

analysis is almost twice that of optical methods, except for Si and Mn, where it is about the same. A 25% staff reduction can be achieved if this instrument is used in quick-analysis laboratories. There are 3 figures and 10 tables.
